

Nami Grant Workspace Quick Start

Associate Director guide · 2026-09-11 · onboarding-v1

This public prototype is for synthetic evaluation only. Neither workspace is an access boundary. No agency accounts are connected.

1. **Orient yourself.** Complete or skip the first-visit orientation. Help → Reopen onboarding brings it back. Start guided demo tours fictional scenarios separately.
2. **Choose Sample workspace.** Use Records at the top. Orientation never resets data. If samples are empty, Load sample portfolio; reset only after exporting changes and confirming.
3. **Review Needs Attention.** Choose Overview. Open queue rows to inspect owners, deadlines and reasons. A blank queue does not prove compliance or complete award coverage.
4. **Inspect a grant.** Choose Grants and search titles, owners or notes. Open a grant to see its requirements, tasks and issues. Edit record saves changes; Status → Archived retains the record.
5. **Follow prerequisites.** Open Government monthly expenditure report and its Depends on task. Complete the prerequisite first, then review the requirement separately. Dates do not shift automatically.
6. **Verify evidence.** A requirement needs a Source / evidence URL before completion. A link is not proof. Source verified on is a manual assertion; more than 30 days old is STALE, absent is UNKNOWN.
7. **Separate finance and issues.** Finances shows manual totals and snapshot dates, not reconciled accounting. Issues records severity and escalation owner; escalation sends no notification.
8. **Review leads.** Grant Radar → open a lead → Promote to pending award creates an unconfirmed Pending grant, not awarded funding.
9. **Preserve changes.** Settings → Export records saves selected-workspace JSON. Choose JSON imports 1–100 records additively; it rejects duplicates and cannot restore or overwrite a workspace.

Help and next steps

Help provides the full online manual and Word/PDF downloads. Settings lists future integrations marked Requires agency configuration. Use HANDOFF.md for agency adoption, security, source verification and recovery requirements. All practice edits must remain synthetic.
